

Distribution diagram: *Output and Dispatch Menus*

With mobile barcode reader terminals:

In the **RF menu** (for tests using the computer screen you get there by using the **admin menu**), choose **Picking Menu and Picking**.

The user scans the PO number and receives the instruction to go to a certain location. Once the location barcode has been scanned, the quantity picked must be confirmed and then they receive the instruction for the next movement and so on until the end of the PO.

If **SUs** are used, the operator scans the UE number before validating the movement. As long as the rule defined for making SUs allows, he can continue to validate movements on the same UE, but if there is no more room, he chooses the “change SU” option.

If shipping units are not used, skip the next step and go directly to **Dispatch Confirmation** when picking is finished.

Loading (Dispatch Menu):

Loading of SUs into the truck can be confirmed on the computer screen or on a mobile terminal. Use the **Truck Load** option in the **Dispatch menu** or on **the RF menu**.

In both cases, you start by giving the round number associated with the truck and then you key-in/scan the numbers of the SUs loaded into the truck.

Dispatch Confirmation (Dispatch Menu):

When the truck is ready to leave, you confirm dispatch. Fill in the shipping round number, and the list of DOs in the round will appear on the screen along with their status. You can also view the shipping units for the round. Depending on how far along preparation is, you may choose to remove certain DOs from the round before confirming dispatch. Dispatch confirmation will close the DOs and the round.

Replenishment:

Part of preparation is replenishment of dedicated picking locations. When there is not enough stock in these locations, the system creates **Replenishment Orders** during the wave. In certain setups preventive replenishment orders can also be generated at the end of waves.

A replenishment movement is made up of two movements, outgoing from reserve and incoming to picking (or it could be outgoing from a box picking location and incoming to a unit picking location). Both movements are validated at the same time. You must wait until replenishment is validated before validating a movement from a pick location with insufficient stock without replenishment

Replenishment is carried out using paper replenishment orders or with the help of mobile barcode reader terminals.

Replenishment with paper ROs: Once the transfers have been made, you **validate replenishment** on the screen (**Outputs menu**) using the RO number to see the movements to be validated.

In the RF menu: (for tests using the computer screen you get there by using the **admin menu**), choose **Stock menu and Replenishment**.

The operator scans the RO number and receives an instruction to go to a certain location. Once he has scanned the location barcode, he should confirm or modify the quantity. Then he receives an instruction to go to the picking location and scan the location barcode there. Next another movement of the RO will appear or the screen will show that the RO is completed.
